

# Efficiently and Securely Manage & Govern data across your collaboration Systems

CAM is a SaaS platform designed to boost team collaboration between the various systems your organization uses every day. It allows users to efficiently create processes which enable smooth user-adoption with enhanced security, governance, & management of their data.

## The Challenge?

As organizations use many collaboration systems, they are faced with many challenges in terms of data management and governance. As data is spread across systems with no logical place for teams to save it, they save it anywhere, with naming conventions and folder structures per their convenience contributing to data chaos within their organizations. This practice makes it difficult for users to effectively collaborate and prevents risk teams from applying the right security and disposition policies.

Integrating various collaboration systems, automating the processes involved in data management & provisioning, and applying the right governance across systems helps your organization enhance your team's collaboration and mitigate privacy risk challenges.

## Why CAM?

### Eliminate Data Chaos

Without rules for the road, collisions are everywhere. We provide consistent lanes, signals and rules for how data flows through your business.

### Minimize Cyber Risk

Without clear governance and management, your data is an easy target for hackers, cyber-attacks, ransomware, and exposure. We lock it down by controlling its context, location, access and entire lifecycle.

### Enhance team efficiency

Teams waste time establishing their own habits for how to communicate, share files, collaborate on documents, and keep track of milestones. We provide templates, rich metadata, and set up consistent workflows to streamline your matter/document/file processing.

### Easily adhere to compliance regulations

Easily remain compliant and avoid unnecessary fines by following disposition policies per your data's convenience.

"CAM provides the necessary usability and functionality that is important for law firms and large legal teams. It enhances native iManage functionality, giving firms what they need for provisioning, user sync, bulk updates, and more. For clients who are moving to the cloud and using Work 10, I think it's the best product out there to get the additional functionality."
